Taurus Vision is one member of the Taurus product family. Every product in the family shares the same visual language, the same naming style and the same support channel.

A NOTE ON NAMING

In this product the word "Version" is always written in full. It is never shortened to "Ver" or "V". Please keep the same style when you write about the product, take screenshots for students, or post results.

What This Software Does, And What It Does Not Do

What It Does

Taurus Vision reads the trading history and the live account state of the MetaTrader 5 account that is currently logged in, and turns it into a full screen analytics dashboard drawn directly on the chart. It gives you, in one place, the kind of account report that traders normally have to upload to an external website to see.

It answers questions such as:

- How much has this account really grown, after deposits and withdrawals are taken out of the picture?
- What is the deepest fall this account has ever taken from its own peak?
- Which currency pairs actually make the money, and which ones only make the trade count look busy?
- Are the long trades better than the short trades?
- Which day of the week and which hour of the day are profitable, and which ones quietly eat the account?
- How long is a trade held on average, and does that differ between buy and sell trades?
- Is the win rate supported by the size of the wins, or is it a large number of small wins hiding a few very large losses?

It also lets you close any open position from the dashboard itself, with a deliberate two step confirmation so that nothing closes by accident.

What It Does Not Do

Please read this list carefully and explain it to every student.

- It is **NOT** a trading signal system. It never tells you to buy or sell.
- It **NEVER** opens a trade. There is no entry logic inside this software.
- It **NEVER** modifies a Stop Loss or a Take Profit.
- It **NEVER** places a pending order.
- It does **NOT** send your data anywhere. It has no internet connection, no web request, no telemetry and no licence server. Everything it shows is read from your own terminal, on your own computer.
- It does **NOT** predict the future. Every number on the screen describes what has already happened.

THE ONE EXCEPTION

The **only** trading action this software can perform is closing a position that you have selected and confirmed twice on screen. Section 13 explains that feature completely.

System Requirements

Platform	MetaTrader 5 only. This software will not compile or run on MetaTrader 4.
Account	Any MetaTrader 5 account — demo, live, cent, hedging or netting. The dashboard reads whatever account is logged in at that moment.
Chart Size	The chart window must be at least about 560 pixels wide, with a body area of at least about 140 pixels high. Below that the dashboard shows a warning message instead of drawing.
Font	Default is "Segoe UI", present on every normal Windows installation. Use "Arial" if it is missing.
AutoTrading	Required <i>only</i> for the close buttons. Every chart and every number works perfectly with AutoTrading off; only the close buttons stop responding.
Files	None. Version 9.00 ships as a single file — no logo bitmap, no DLL, no configuration file.

Installation, Step By Step

Follow these steps exactly. They take about two minutes.

1

Open the data folder. In MetaTrader 5, click **File > Open Data Folder**. A Windows folder opens — this is the private folder of your terminal. Inside it you will see a folder called **MT5**.

Place the file. Open **MT5 > Experts** and copy in the file **ForexGuru_Pk_Taurus_Vision_Trader_Dashboard.mq5**.

2

IMPORTANT

It goes into "Experts", **NOT** into "Indicators". Version 9.00 is an Expert Advisor. If you place it in the Indicators folder it will either fail to appear or fail to close trades.

Compile. Back in MetaTrader 5, press **F4**, or click **Tools > MetaQuotes Language Editor**. In the Navigator, open **Experts >**

- 3** **ForexGuru_Pk_Taurus_Vision_Trader_Dashboard.mq5** and press **F7** to compile. You should see **0 error(s), 0 warning(s)** in the Errors tab. A file with the extension **.ex5** is now created — that is the program the terminal actually runs.

- 4** **Refresh the Navigator.** Return to MetaTrader 5. In the Navigator window (**Ctrl+N**), right click on "Expert Advisors" and choose "Refresh". The entry now appears in the list.

- 5** **Attach it to a chart.** Open any chart — the symbol and timeframe do not matter, the dashboard studies the whole account, not the chart it sits on. Drag the Expert Advisor from the Navigator onto that chart to open the settings window.

- 6** **Tick "Allow Algo Trading".** In the settings window, open the "Common" tab and tick it. Do this even if you do not intend to use the close buttons.

- 7** **Type your name, then press OK.** Open the "Inputs" tab. Find the field **>>> TYPE YOUR FULL NAME HERE <<<** and replace the placeholder text with your own full name.

- 8** **Switch on AutoTrading.** On the main toolbar of the terminal, the "AutoTrading" button must be green. Click it once if it is red.

Installation is complete. The dashboard fills the chart immediately.

SECTION 05

First Run Checklist

Run through this list the first time you attach the dashboard.

DID YOU TYPE YOUR NAME?

If the big heading at the top of the screen still shows the product name, and a red line underneath reads ">>> Open Expert Settings And Type Your Name In "Trader Name" <<<", the name has not been set. On the About tab, the row "Licensed To" will also show, in red, "Not Set — Type Your Name In Settings". Press F7 on the chart, open Inputs, type your name, press OK.

IS THE AUTOTRADING BUTTON GREEN?

If it is red and the close buttons are switched on, the Experts log prints a plain reminder when the dashboard starts.

IS THE ACCOUNT HISTORY DOWNLOADED?

MetaTrader 5 only shows the deal history that the terminal has already received from the broker. If the Account Growth panel says "Not Enough History Data" on an account you know has traded, open the Toolbox (**Ctrl+T**), go to the History tab, right click and choose "All History".

IS THE CHART MAXIMISED?

The dashboard is designed for a full chart window. On a small window it still works, but panels shrink and rows are dropped to fit.

ONLY ONE EXPERT ADVISOR PER CHART

MetaTrader 5 allows only one Expert Advisor on a chart at a time. If you already run a trading robot on a chart, put the dashboard on a different chart.

SECTION 06

Anatomy Of The Screen

From top to bottom, the dashboard is built from five fixed zones. The middle zone changes with the tab you select; everything else stays where it is.

The complete screen, shown here on the Overview tab. The five zones — header, toolbar, KPI ribbon, panel body, footer — are visible top to bottom.

Zone 1 — The Header

The header (top) and toolbar (bottom row of tab chips and controls).

A dark gradient bar with a thin gold line under it, carrying three blocks:

Left	Broker company name, server name, leverage and account currency.
Centre	"Trading Dashboard Of <Your Name>" in large gold letters, with the product name and version underneath. Before you set your name, the centre shows the product name and a red instruction line instead.
Right	Account number, Balance, Equity.

The centre title carries no brackets around the trader name — that is deliberate and part of the brand style.

Zone 2 — The Toolbar

A single row of controls under the header: five tab chips on the left (Overview, Statistics, Analytics, History, About — the active tab is filled gold), and on the right, the theme switch (drawn moon or sun), the "Expand All" / "Collapse All" chips, and a quiet "Updated hh:mm:ss" line.

When the chart is narrow, the toolbar drops controls from the right hand side rather than overlapping them. The tabs are never dropped.

Zone 3 — The KPI Ribbon

The KPI ribbon: Gain, Balance, Equity, Floating P/L, Closed Profit, Max Drawdown, Win Rate — each with a small note in the bottom right corner.

A row of up to seven cards giving the headline numbers of the account. Each card has a small coloured stripe on its left edge, a label, a large value and a small note in the bottom right corner.

Card	Note Shown
Gain (Time Weighted)	Absolute gain
Balance	Peak balance ever reached
Equity	Account leverage
Floating P/L	Number of open positions
Closed Profit	Number of closed trades
Max Drawdown	The same drawdown in money
Win Rate	Profit factor

If the chart is too narrow for seven readable cards, the ribbon drops cards from the right, down to a minimum of three. It can also be switched off entirely with "Show Top KPI Ribbon", and it is always hidden on the About tab.

Zone 4 — The Panel Body

The working area. Its contents change with the selected tab. Every item is a "panel": a rounded rectangle with a title bar, an optional note on the right of the title bar, and a body. The layout engine gives each row of panels the height it asks for, handing spare height to the panels that gain the most from being taller.

Zone 5 — The Footer

Hassan Khalid | USD Account | 250674690

Version 8.00 | +92-300-6561240 | support@forexguru.pk

Powered By ForexGuru.Pk

The footer: trader name, currency and account number on the left; version and contact details in the centre; the brand line on the right.

The footer is designed to survive a screenshot. When a student sends you a picture of the dashboard, the footer already tells you whose account it is, in which currency, and on which account number.

SECTION 07

How To Operate The Dashboard

Everything in the dashboard is operated with a single **left mouse click** on the chart. There is no right click menu, no keyboard shortcut and no drag operation.

7.1 Switching Tabs

Click one of the five chips on the left of the toolbar. The panel body is replaced immediately. When the dashboard is restarted it returns to the tab named in the setting "Opening Tab".

7.2 Collapsing And Expanding A Panel

Click anywhere on the **title bar** of a panel. The panel folds up to just its title bar, and the panels around it take the freed space. Click the title bar again to expand it. This is the fastest way to give one chart the whole screen for a screenshot.

7.3 Expand All / Collapse All

These two chips act on **every panel on all five tabs** at once, not only the tab you are looking at. Use them to reset the layout after experimenting.

7.4 The Theme Switch

Click the chip showing the moon or the sun.

Dark (Luxury Gold)	Gold on near black. The normal working theme.
Light (Print / Screenshot)	Dark ink on white. Made for printing, projecting on a classroom screen, and screenshots pasted into a white document or PDF.

The glyph shown is the theme that is currently live: a moon for Dark, a sun for Light. Changing the theme also re-applies the chart background colour, so the chart behind the dashboard matches instantly.

7.5 The Shared Pager

Six tables can hold more rows than fit on the screen: Current Active Trades, Closed Trade History, Deposits & Withdrawals, Reward : Risk By Symbol, Average Holding Time, and Currency Popularity. All six use the **same** pager control, on the right hand side of the panel title bar:

TWO BEHAVIOURS WORTH KNOWING

- (a) Both arrows **wrap**. From the last page, ">" returns to page 1. From page 1, "<" jumps to the last page.
- (b) On a narrow panel there may be no room to draw the "<" arrow. The ">" arrow is always drawn, and because it wraps, every page stays reachable even when the back arrow is not visible.

Each table remembers its own page independently.

7.6 In-Panel Tab Strips

Two panels carry a small strip of chips inside their body: **Account Growth** (Growth % | Balance | Profit | Drawdown) and **Currency Popularity** (By Symbol | By Strategy). Click a chip to change what the panel displays.

7.7 The Year Strip

The "Monthly Gain (Change)" panel carries one chip per year in which the account traded. Click a year to study that year. The dashboard opens on the **newest year** by default.

7.8 The Close Buttons

A small red "X" appears at the right hand end of each row in the Current Active Trades table. This is the only control in the product that can change your account. It is explained fully in Section 13.

7.9 How Often The Screen Updates

Three clocks keep the dashboard alive: a one second timer redraw, incoming price ticks (throttled to about four times per second), and the full history recalculation, which runs only every few seconds (setting: "History Recalculation Interval"). Opening or closing a trade triggers a rebuild on the next timer beat, about one second later — deliberately not done instantly, to avoid freezing the terminal's trading pipeline.

7.10 A Click Guard You May Notice

Two clicks on the **same** control inside 300 milliseconds are treated as one, to stop an accidental double click from firing an action twice.

SECTION 08

Tab 1 — Overview

The daily working view. Three panels: what the account is, how it grew, and what is open right now.

8.1 Panel: Account Summary

Account Summary				Jan 2, 2020
Abs. Gain:	+768.12%	Highest Bal.:	\$75480.37	
Daily:	+0.13%	Max Drawdown:	23.99%	
Monthly:	+4.10%	Closed Profit:	\$96015.45	
Deposits:	\$12500.00	Free Margin:	\$59596.70	
Withdrawals:	\$38830.00	Used Margin:	\$17259.37	

Account Summary. Title bar note: the date of the first record found in the account history.

Abs. Gain	Absolute gain. Total closed profit divided by total deposits, as a percentage.
Daily	Average compounded daily return implied by the whole growth of the account.
Monthly	The same figure compounded over thirty days.
Deposits	Sum of every deposit found in the history.
Withdrawals	Sum of every withdrawal, shown as a positive number.
Interest/Swap	Total swap paid or received across all closed trades.
Highest Bal.	The highest balance the account has ever reached.
Max Drawdown	The deepest fall, in percent, from a peak balance.
Closed Profit	Net profit of all closed trading, excluding deposits/withdrawals.
Free Margin / Used Margin / Margin Level	Live values from the terminal. Margin Level shows a dash with no position open.

8.2 Panel: Account Growth

Account Growth, in the Growth % view. The quiet grey line is the raw Balance — comparing the two is one of the most useful teaching pictures in the whole dashboard.

The four views of the same chart: Growth % (with the balance overlay), Balance, Cumulative Profit, and Drawdown (drawn downward from zero, in red).

Growth %	Time weighted growth. A deposit does not make the line jump, because a deposit is not a trading result. In this view only, a quieter grey Balance line is drawn on top for comparison.
Balance	The raw account balance after every deal.
Profit	Cumulative trading profit in money, starting from zero.
Drawdown	The drawdown percentage at each point, drawn downward from zero, in red — showing not only how deep the falls were, but how long the account stayed under water.

A green dot on the bottom axis marks a deposit; a red dot marks a withdrawal. If fewer than two history points exist, the panel prints "Not Enough History Data".

8.3 Panel: Current Active Trades

Current Active Trades							
SYMBOL	TYPE	VOLUME	OPEN	CURRENT	PIPS / MOVE	SWAP	PROFIT CLOSE
EURUSD	BUY	2.40	1.14863	1.15383	52.0	-11.31	\$1247.60 X
XAUUSD	BUY	1.20	4356.647	4364.857	821.0	-12.74	\$985.15 X
TOTAL		41.45					\$7170.62

Current Active Trades. Note the red "X" close button on the far right of each row — see Section 13 for exactly how it works.

Symbol / Type / Volume	Instrument, BUY (green) or SELL (red), and lots.
Open / Current	Open price and current price, at the instrument's own digit count.

Pips / Move	Pips for a Forex pair; raw price move for anything else (Section 16.2).
Swap	Swap accumulated on that position so far.
Profit	Floating profit of the position, without swap.
Close	The two step close button, if switched on.

A DETAIL WORTH NOTING

The **TOTAL** line at the foot of the panel **includes** swap, while the PROFIT column of each row **excludes** it. The two figures differ by exactly the sum of the SWAP column — the row shows the market result, the total shows the true cash position.

When there is nothing open, the panel prints "No Open Trades".

SECTION 09

Tab 2 — Statistics

The report card of the account. Three panels.

9.1 Panel: Trade Statistics

Trade Statistics

3164 Closed Trades | 425 Non-FX (Excluded From Pips)

Trades:	3164	Average Win:	9363.1 pips / \$281.75	Best Trade:	Jun 15 \$3181.24
Profitability:	58.5%	Average Loss:	-11104.3 pips / -\$324.53	Worst Trade:	May 22 -\$3383.13
Won / Lost:	1852 / 1312	Longs Won:	(930/1590) 58%	Best (Pips):	Jan 9 394309.0

Trade Statistics. The title bar note names how many trades were excluded from pip totals as non-Forex — see Section 16.2.

Trades / Profitability / Won-Lost	Count of closed trades, win-rate bar, and the raw won/lost split.
Pips (FX) / Lots / Commissions	Total pips on Forex trades only ("n/a" if none), total volume, total commission.
Average Win / Average Loss	Average pips and money of a winning / losing trade.
Longs Won / Shorts Won	Win counts and rate, split by direction.

Profit Factor	Gross profit ÷ gross loss. Green at 1.00+, red below.
Expectancy	Net profit ÷ number of closed trades — what one average trade is worth.
Best / Worst Trade, Best / Worst (Pips)	Date and size of the extremes, in money and in pips.
Avg. Trade Length / Total Swap	Average holding time; total swap over all closed trades.

TEACHING NOTE

Profit Factor and Win Rate should always be read together. A win rate of 80% with a profit factor of 0.8 means the account wins often and loses badly — the classic profile of an account that will eventually be wiped out by one trade.

9.2 Panel: Monthly Gain (Change)

Monthly Gain, with the year strip along the top. Click a year to study that year; the title bar shows the year's total.

Each month's percentage is that month's trading profit divided by the account balance at the **start** of that month — the standard method used by public trading statistics sites. If the account has no monthly data at all, the panel prints "No Monthly Data".

9.3 Panel: Currency Popularity

Currency Popularity, in "By Symbol" mode. Click "By Strategy" to regroup the same trades by magic number instead.

The donut divides the account by **trade count**, not by profit. The table columns are Symbol/Strategy, Share, Net, and R:R (average win ÷ average loss for that entry — see Section 15 for the two special cases: "-" and "No Loss").

PRACTICAL USE

The **By Strategy** view is the fastest way to answer: is this account making money from the robot, or from the manual trades?

SECTION 10

Tab 3 — Analytics

The diagnostic tab. Four panels that look for patterns and habits rather than totals.

10.1 Panel: Reward : Risk By Symbol

Reward : Risk By Symbol. A thin reference line marks the ratio 1.0; bars past it are green, bars short of it are red.

Three states are possible, and all three are labelled honestly: a real ratio, "No Loss" (wins exist but no losing trade has ever been taken on that instrument — common on a young account), or "-" (nothing measurable yet).

IMPORTANT FOR TEACHING

This is a **historical** reward to risk ratio, computed from what actually happened. It is **not** the planned risk to reward of a trade setup. A student who plans 1:3 on every entry may still see 0.8 here — that gap is exactly the lesson.

10.2 Panel: Average Holding Time

Average Holding Time. Green (upper) is the average long hold; red (lower) is the average short hold, per instrument.

The duration printed on the right of each row is the **longer** of the two averages. When an instrument has only ever traded in one direction, a single full height bar is drawn instead of a half height bar with an empty slot.

TEACHING NOTE

A large gap between the green and red bar is a real and very common bias — traders often let losers run in one direction and cut them quickly in the other. This panel makes that habit visible in a way a trade list never does.

10.3 Panel: Net P/L By Day Of Week

Net P/L By Day Of Week. Bars are green above zero, red below. The small number at each tip is the trade count closed that day.

10.4 Panel: Net P/L By Hour Of Day

Net P/L By Hour Of Day, labelled 00–23. On a narrow panel only every third hour is labelled.

READ THE TIME ZONE WARNING

These hours are **broker server hours**, not local Pakistan time. Most brokers run a server two or three hours ahead of or behind local time. Check your broker's server offset in Market Watch before drawing conclusions about trading sessions.

SECTION 11

Tab 4 — History

The record tab. Everything here is a plain, auditable list.

11.1 Panel: Closed Trade History

Closed Trade History									
SYMBOL	TYPE	LOTS	OPENED	CLOSED	HELD	IN	OUT	PIPS	NET P/L
XAUUSD	BUY	0.14	Aug 11 07:17	Aug 11 12:19	5h 1m	3360.260	3389.620	2936.0	\$408.25
AUDUSD	SELL	1.04	Aug 10 03:04	Aug 11 02:09	23h 5m	0.64668	0.65467	-79.9	\$833.70
GBPUSD	BUY	0.76	Aug 10 21:19	Aug 10 23:49	2h 30m	1.32961	1.33961	100.0	\$745.50

Closed Trade History, newest first. This table is the place to send a student who disputes a number elsewhere in the dashboard — every aggregate in the product is built from these rows.

Ten columns: Symbol, Type, Lots, Opened, Closed, Held, In (volume weighted average entry), Out (volume weighted average exit), Pips, and Net P/L (includes commission and swap — the true cash effect).

11.2 Panel: Deposits & Withdrawals

Deposits & Withdrawals			
DATE	TYPE	AMOUNT	BALANCE AFTER
Jul 31, 2026	WITHDRAWAL	-\$2450.00	\$66461.59
May 31, 2026	WITHDRAWAL	-\$2370.00	\$63987.93
Mar 31, 2026	WITHDRAWAL	-\$1250.00	\$60574.77
Jan 31, 2026	WITHDRAWAL	-\$690.00	\$57212.83
Nov 30, 2025	WITHDRAWAL	-\$270.00	\$56455.65

Deposits & Withdrawals, newest first. Deposits in green, withdrawals in red.

When the account has no funding records at all — normal on a demo account created with a starting balance — the panel prints "No Funding Records".

11.3 Panel: Risk Metrics & Records

Risk Metrics & Records

1714 Active Days

Sharpe (Ann.):	1.71	Max Drawdown:	23.99%	Max Cons. Wins:	11
Sortino (Ann.):	2.80	Max DD (Money):	\$7816.60	Max Cons. Losses:	11
Z-Score:	3.39	Best Day:	Aug 5 \$4377.13	Best Win Run:	\$5876.41
Recovery Factor:	12.28	Worst Day:	Jul 10 -\$4310.93	Worst Loss Run:	-\$6142.40
Profit Factor:	1.23	Longest Trade:	8d 7h	Trades / Week:	9.2
Expectancy:	\$30.35	Avg. Trade:	2d 2h	Trades / Month:	39.9

Risk Metrics & Records — the professional grade measures. Every formula is given in Section 15.

Quality of Return	Sharpe (Ann.), Sortino (Ann.), Z-Score, Recovery Factor, Profit Factor, Expectancy.
Damage and Duration	Max Drawdown, Max DD (Money), Best Day, Worst Day, Longest Trade, Avg. Trade.
Behaviour and Activity	Max Cons. Wins, Max Cons. Losses, Best Win Run, Worst Loss Run, Trades/Week, Trades/Month.

TEACHING NOTE ON MAX CONS. LOSSES

This single number is the most useful risk figure most students will ever meet. If the account has already seen nine losses in a row, then a risk of 5% per trade would have destroyed 37% of the account in one ordinary losing run. Ask every student to compare this number against their own position sizing.

12.1 Panel: About This Software

About This Software

Version 8.00

Taurus Vision

Forex Traders Dashboard
Version 8.00 | Standard Edition

Product	ForexGuru.Pk Taurus Vision Trader Dashboard
Version	Version 8.00 (August 2026)
Platform	MetaTrader 5 - Expert Advisor
Publisher	Digital Technologies Pakistan
Developed By	DigiTech.Com.Pk Team

About This Software — the wordmark block and the fact rows. "Licensed To" turns red until a name is entered.

Eight fact rows: Product, Version, Platform, Publisher, Developed By, Partners, Supervision, and Licensed To.

12.2 Panel: How To Use This Dashboard

How To Use This Dashboard

Quick Start

1. Open Expert Properties And Type Your Full Name In "Trader Name".
2. Use The Tab Bar To Move Between Overview, Statistics, Analytics, History And About.
3. Click Any Panel Title To Collapse Or Expand That Panel.
4. Use Expand All Or Collapse All To Reset The Whole Layout In One Click.
5. Switch Theme Between Dark And Light Before Taking Screenshots For Students.
6. On The Growth Panel Choose Growth, Balance, Profit Or Drawdown.
7. On The Monthly Panel Use The Year Strip To Select A Trading Year.
8. Set History Days In Settings To Limit The Study To A Recent Period.

How To Use This Dashboard — a quick start card built into the software itself, so a student who has lost this help file still has the essentials on screen.

In Version 9.00 this card carries nine steps — the ninth explains the close button confirm window, using your own configured number of seconds rather than a fixed figure.

12.3 Panel: Support, Credits And Notice

Support, Credits And Notice		
PUBLISHER	SUPPORT	SUPERVISION
Digital Technologies Pakistan	support@forexguru.pk	Dr. Zia ul Hassan
ForexGuru.Pk	support@digitech.com.pk	International Forex Trainer & Analyst
DigiTech.Com.Pk	Include Your Account Number	Developed By DigiTech.Com.Pk Team
Phone: +92-300-6561240	And A Screenshot Of The Chart	Version 8.00 - August 2026
This Dashboard Reads Your Own Account History. It Never Opens Or Modifies A Trade. A Position Closes Only After You Confirm It Twice On Screen. Past Results Do Not Guarantee Future Results. (c) 2026 Digital Technologies Pakistan		

Support, Credits And Notice — publisher, support, and supervision columns, with the standard notice line across the bottom.

The notice line reads: *"This Dashboard Reads Your Own Account History. It Never Opens Or Modifies A Trade. A Position Closes Only After You Confirm It Twice On Screen. Past Results Do Not Guarantee Future Results."*

SECTION 13

One Click Trade Closing, In Full

This is the only feature in the product that can change your money. Read this section completely before you use it, and make sure every student has read it too.

Current Active Trades							
SYMBOL	TYPE	VOLUME	OPEN	CURRENT	PIPS / MOVE	SWAP	PROFIT CLOSE
EURUSD	BUY	2.40	1.14863	1.15383	52.0	-11.31	\$1247.60 X
XAUUSD	BUY	1.20	4356.647	4364.857	821.0	-12.74	\$985.15 X
TOTAL		41.45					\$7170.62

The CLOSE column, on the far right of the Current Active Trades table.

13.1 Where It Is

Overview tab > Current Active Trades > the CLOSE column on the far right of each row.

13.2 How To Close A Position

It is deliberately a **two step** action.

1

Click the red "X" on the row of the position you want to close. The button changes to "OK" and turns into a filled red chip. A status line appears at the foot of the panel: *"Click OK Again To Close Ticket 123456789 (6s)"*. The number in brackets counts down every second.

2

Click "OK" before the countdown reaches zero. The position is closed at market. The status line is replaced by the result, for example: *"Closed EURUSD Ticket 123456789"*.

If you do **not** click the second time, the arming expires on its own and the button returns to a plain "X". Nothing is closed. You can also cancel deliberately: click the "X" of a different row, or switch the theme.

13.3 Why Two Steps

The dashboard covers the whole chart. A single stray click, a slipping mouse, or a student demonstrating something on a live account could otherwise close a real position instantly and irreversibly. One click arms; a second, conscious click executes. Nothing closes by accident.

13.4 The Countdown Clock

The countdown uses the computer's own millisecond clock, not the broker's server time. Server time only advances when a price tick arrives, so on a quiet symbol or over a weekend the countdown would otherwise freeze and an armed ticket would never expire. The computer clock keeps running whether or not the market does.

13.5 Settings That Control It

Show One Click Close Button On Open Trades	Default: true. Set to false and the CLOSE column disappears completely — the dashboard becomes strictly read only. Recommended for a shared classroom terminal.
Confirm Window Seconds (Click X Twice)	Default: 6. Forced into the range 2 to 60 seconds — a value of zero would have thrown away the entire safety guard.
Maximum Slippage In Points	Default: 30. The maximum price movement accepted between your click and the fill.

13.6 Messages You May See, And What They Mean

Message	Meaning
"AutoTrading Is Switched Off In The Terminal Toolbar"	The AutoTrading button on the main toolbar is red. Click it once.
"Allow Algo Trading Is Not Ticked In The Dashboard Settings"	Press F7, Common tab, tick "Allow Algo Trading", press OK.
"This Account Does Not Allow Expert Advisor Trading"	The broker has disabled EA trading on this account. Contact your broker.
"Position Was Already Closed"	Between your first and second click, the position closed itself — SL, TP, or another device.
"Trading Is Disabled On <symbol> Right Now"	The market is closed, or the broker has disabled it. Wait for the session to open.
"Close Failed: <number> <description>"	The broker rejected the request with its own return code. Send this whole line to support.

13.7 What It Will Never Do

- It will never close a position you did not click on.
- It will never close ALL positions at once — there is no "close all" button anywhere in this product, deliberately.
- It will never open a position, or move a Stop Loss or Take Profit.
- It will never partially close. The whole position is closed.

SECTION 14

Complete Settings Reference (Every Input)

Press F7 on the chart to reopen the settings at any time. Changing a setting restarts the dashboard, which resets the current tab and page positions but changes nothing in your account.

Group: Product / Publisher

These fields fill the About tab and the footer. Change them only if you are an authorised partner distributing under your own contact details.

Developed By	"DigiTech.Com.Pk Team"
Publisher	"Digital Technologies Pakistan"
Primary / Secondary Website	"ForexGuru.Pk" / "DigiTech.Com.Pk"
Contact Phone	"+92-300-6561240"
Support Email One / Two	"support@forexguru.pk" / "support@digitech.com.pk"
Team Partners	"ForexGuru.Pk"
Under Supervision Of / Supervisor Title	"Dr. Zia-al-Hassan" / "International Forex Trainer & Analyst"

Group: Trader

>>> Type Your Full Name Here <<<	Default: "Enter Your Name Here". Until replaced, the header shows a red instruction and the About tab shows "Licensed To: Not Set" in red. Leading/trailing spaces removed automatically.
Money Prefix	Default: "\$". Leave blank and the dashboard uses the real account currency code instead — "PKR ", "USD ", "EUR " and so on.

Group: Appearance

Theme	Default: Dark (Luxury Gold). Other choice: Light (Print / Screenshot). Sets the <i>starting</i> theme only; the toolbar switch changes it while running.
Auto Scale Fonts To Chart Size	Default: true. Text scales against a 1280×760 reference, limited to the range 0.92–1.75.
Master Font Size %	Default: 115. Range 80–200. Applied on top of automatic scaling. No text ever drops below 12 pixels.
Font Name	Default: "Segoe UI". Use "Arial" if missing.
Rounded Panel Corners / Soft Panel Shadow / Striped Table Rows	All default: true.

Force Chart Background To Theme	Default: true. Repaints the chart background to match.
Hide Price / Time Scale And One-Click	Default: true. Hides the price scale, time scale, one click panel and OHLC line. Both chart settings are saved on startup and restored on removal.

Group: Custom Colours (Override Theme)

Use Custom Colours Below	Default: false. When true, your nine colours replace the theme, and the toolbar theme switch stops changing the appearance.
Background / Panel Background / Header Background	RGB 13,17,23 / 22,27,34 / 31,38,48
Border Colour	RGB 55,63,73
Text Colour Primary (Gold) / Main / Secondary	RGB 216,180,68 / 234,240,246 / 168,178,190
Profit Colour / Loss Colour	RGB 70,192,92 / 243,96,86

Group: Start-Up View

Opening Tab	Default: Overview.
Account Summary / Growth Chart / Open Trades / Trade Statistics / Monthly Gain / Currency Popularity Expanded	All default: true. Control the <i>starting</i> state only — every other panel always starts expanded.
Show Top KPI Ribbon	Default: true. Ribbon is always hidden on the About tab regardless of this setting.

Group: Layout

Cover Whole Chart	Default: true. Fills the entire chart window and follows resizing.
Panel X / Y / Width / Height	Default: 5 / 20 / 1280 / 800. Used only when "Cover Whole Chart" is false, placing the dashboard as a fixed rectangle.

Group: Trade Control

Show One Click Close Button On Open Trades	Default: true
Confirm Window Seconds (Click X Twice)	Default: 6 (clamped 2–60)
Maximum Slippage In Points	Default: 30

All three are explained in Section 13.

Group: Data

History Days	Default: 0 (entire available history). Set to 30/90/180/365 to study only a recent period — every figure in the dashboard then describes that window only.
History Recalculation Interval (Sec)	Default: 5. Raise to 10–15 on a very old account with tens of thousands of deals. The screen still redraws every second; only the heavy recalculation is controlled here.
Risk Free Rate % Per Year (For Sharpe)	Default: 0.0. Used in the Sharpe and Sortino formulas. Raising it lowers both figures.

TEACHING TIP

"History Days" is an excellent teaching tool. Show a student their whole history, then set 90 and show them the last quarter. Traders who are improving and traders who are drifting look completely different when you compare the two views.

SECTION 15

Glossary — The Meaning And The Formula Of Every Number

This section is written so it can be handed to a student on its own.

Absolute Gain (Abs. Gain)

How much trading has added, measured against the money you actually put in.

$$\text{Net closed profit} \div \text{total deposits} \times 100$$

Gain (Time Weighted)

Growth from trading only, with deposits and withdrawals removed. The history is cut into segments at every deposit and withdrawal; each segment's growth factor is calculated separately and multiplied together. A deposit starts a new segment instead of registering as a gain — the same method used by professional fund reporting.

Daily % and Monthly %

The steady compounded rate that would have produced the same overall growth over the same period.

$$\text{Daily} = (\text{growth factor} ^ { (1/\text{days}) } - 1) \times 100$$

$$\text{Monthly} = (\text{growth factor} ^ { (30/\text{days}) } - 1) \times 100$$

Not a forecast, and not the return of today or this month.

Maximum Drawdown

The deepest fall from the account's own highest point.

$$(\text{peak balance} - \text{current balance}) / \text{peak balance} \times 100$$

This is a **balance** drawdown from closed deals — it does not include floating loss on positions still open (see Section 16.4).

Win Rate

$$\text{winning trades} / \text{total closed trades} \times 100$$

A trade closing at exactly zero counts as a **win**, not a loss.

Profit Factor

How many rupees the account earned for every rupee it lost.

$$\text{gross profit of winners} / \text{absolute gross loss of losers}$$

Below 1.00 is losing. Above ~1.30 is respectable. Above 3.00 on a small sample usually means the sample is too small.

Expectancy

What one average trade is worth, in money.

$$\text{net profit} / \text{number of closed trades}$$

Reward : Risk (per symbol / per strategy)

$$(\text{gross win} / \text{number of winners}) \div (\text{absolute gross loss} / \text{number of losers})$$

Historical, not planned. If there are no losers yet, the panel says "No Loss".

Sharpe Ratio (Annualised)

Return per unit of variability — did the profit arrive smoothly or through wild swings?

$$\text{Sharpe} = (\text{avg daily return} - \text{daily risk free rate}) / \text{stdev}(\text{daily returns}) \times \sqrt{252}$$

Below 1 is weak, 1–2 is good, above 2 is very good (check sample size).

Sortino Ratio (Annualised)

The same idea as Sharpe, but only punishes **downside** variability — a violently profitable day is not treated as "risk". Normally higher than Sharpe; if much higher, the account's variability is mostly on the winning side.

Z-Score

Do wins and losses come in streaks, or are they random? The classic runs test.

$$P = 2 \times \text{wins} \times \text{losses}$$
$$Z = (N \times (\text{runs} - 0.5) - P) / \sqrt{ P \times (P - N) / (N - 1) }$$

Beyond ± 1.96 is meaningful at 95% confidence. Negative = streaks (common in trend following); positive = alternation; near zero = random, the normal result for most accounts.

Recovery Factor

Profit produced for each unit of pain at the account's worst moment.

$$\text{net profit} / \text{maximum drawdown in money}$$

Below 1 means the account has not yet earned back more than its worst fall.

Active Days

Days on which the account produced a non-zero trading result.

Pips

The standard unit of price movement for a currency pair. On a 5-digit or 3-digit quote, one pip is ten points; otherwise one pip is one point. Sign is inverted for a SELL, so a profitable sell shows positive pips. Calculated **only** for Forex-classified instruments (Section 16.2).

Monthly Gain

$$\text{month profit} / \text{balance at start of month} \times 100$$

Maximum Consecutive Losses

The longest unbroken run of losing trades in the whole history — the number that should decide how big a position you can safely take.

Short Money Notation

Where space is tight: \$1,250 → "\$1.3K" (thousands, one decimal); \$2,400,000 → "\$2.40M" (millions, two decimals). Full precision is always available on the History tab.

Duration Notation

"2d 4h" (two days, four hours) · "6h 30m" · "45m" · "-" (no measurable duration)

SECTION 16

Honest Limits And Known Behaviour

Every analytics product has boundaries. Hiding them is how students end up drawing wrong conclusions from right numbers. These are ours, stated plainly.

16.1 It Is An Expert Advisor, Not An Indicator

Earlier versions of Taurus Vision were custom indicators. MetaTrader 5 does not allow a custom indicator to call any trade function. Because Version 9.00 closes positions, it had to become an Expert Advisor — it lives in `MQL5\Experts`, not `MQL5\Indicators`, and only one Expert Advisor is permitted per chart.

16.2 Pips Are Calculated For Forex Pairs Only

The word "pip" has an agreed meaning on a currency pair and no agreed meaning anywhere else. On a two digit crypto quote, a \$46 move becomes "4,674 pips" — meaningless, and it would pollute every pip average on the screen.

- Only Forex-classified instruments contribute to Pips (FX), Average Win/Loss pips, Best/Worst (Pips).
- Everything else — gold, silver, indices, crypto, share CFDs — is excluded from those figures.
- The Trade Statistics title bar names exactly how many trades were excluded.
- Trade tables still show the raw price movement for non-FX instruments.
- If the account has never traded a Forex pair, pip fields show "n/a" rather than a misleading zero.

16.3 Sharpe And Sortino Are Slightly Optimistic

Both ratios are built from a daily return series that only contains days on which the account had activity. Excluding flat days removes a set of zero returns that would otherwise pull the average down — so these figures run somewhat higher here than a strict calendar based Sharpe. Valid for comparing one period of

your own account against another; not directly comparable to a fund's published Sharpe.

16.4 Drawdown Is Balance Based

Drawdown is computed from closed deals, measuring the fall of the **balance**. Floating loss on positions still open at the time is not included. This is a limit of the data — MetaTrader 5 does not store a historical record of equity or floating profit; nothing can recover it afterward.

16.5 The Hour Chart Is In Server Time

Net P/L By Hour Of Day uses broker server hours, and says so in its own title bar. Check your broker's server offset before concluding anything about sessions.

16.6 Everything Depends On Downloaded History

The dashboard can only see the deals your terminal has actually received. Set the Toolbox History tab to "All History" for the complete picture.

16.7 Breakeven Trades Count As Wins

A trade closing at exactly zero is counted as a winner.

16.8 The Profit Column And The Total Line Differ By Swap

In Current Active Trades, the PROFIT column excludes swap (it has its own column); the TOTAL line includes it. The difference is exactly the sum of the SWAP column.

16.9 What The Product Cannot Show, And Why

Two features often requested cannot be reconstructed from MetaTrader 5 deal history, no matter how the software is written:

- **MAE/MFE excursion charts** — how far a trade went against and in favour of you before closing. Requires tick by tick logging while the trade is open, which history does not store.
- **A true historical equity curve** including floating profit — MetaTrader 5 does not keep it (see 16.4).

Any product claiming to produce these from history alone, on an account it was not running on, is estimating, not reporting.

16.10 Settings Are Not Saved Between Restarts

The tab, scroll pages, collapsed panels and theme you have chosen live only while the dashboard runs. Set a permanent layout via the Start-Up View settings and save it as a chart template.

Troubleshooting

Problem	Check
Nothing appears after I drag it onto the chart.	Look at the top right corner of the chart for a sad/smiling face icon. If neither appears, repeat Step 5 of Section 4 and check the Experts tab in the Toolbox.
"Chart Window Too Small"	Maximise the chart window, or lower "Master Font Size %" from 115 to 95 or 85.
Red warning line under the header.	Your name has not been set. Press F7, Inputs tab, first field.
Close buttons do nothing.	Check, in order: AutoTrading button green? "Allow Algo Trading" ticked (F7, Common)? Read the status line — Section 13.6 lists every message.
No close buttons at all.	"Show One Click Close Button" is false, or there are no open positions.
Growth panel says "Not Enough History Data".	Ctrl+T, History tab, right click, "All History".
Pips show "n/a" or totals look small.	Read Section 16.2 — correct behaviour on a non-Forex account.
A pager arrow is missing.	The "<" is dropped on a narrow panel. ">" always wraps, so every page stays reachable.
Clicking sometimes seems ignored.	Two clicks within 300ms count as one — slow down slightly.
Terminal feels slow on a very old account.	Raise "History Recalculation Interval" to 15, or set "History Days" to 365.
My chart looks wrong after removing the dashboard.	Should not happen — properties are saved/restored automatically. If needed, press F8 and reset chart properties manually.
Numbers don't match my broker's statement exactly.	This dashboard includes commission and swap inside the net result of each trade. Compare a single trade in Closed Trade History against the terminal's own History tab; they will agree.

Frequently Asked Questions

WHICH CHART AND TIMEFRAME SHOULD I USE?

Any. The dashboard analyses the account, not the chart.

CAN I RUN IT ON MORE THAN ONE CHART AT ONCE?

Yes, but every copy shows the same account and it costs processing power for nothing.

CAN I RUN IT ALONGSIDE MY TRADING ROBOT?

Yes, but on a different chart — MetaTrader 5 allows only one Expert Advisor per chart.

IS IT SAFE ON A LIVE ACCOUNT?

It reads history and never opens or modifies a trade on its own. The only action it can take is closing a position you clicked and then confirmed. For a classroom terminal, set "Show One Click Close Button" to false to make it strictly read only.

DOES IT SEND MY DATA ANYWHERE?

No. It makes no internet connection of any kind, and needs no licence or activation.

DOES IT WORK ON A PKR ACCOUNT, OR A CENT ACCOUNT?

Yes. Set "Money Prefix" to blank to use the real account currency code. It also works on netting accounts.

WHY DOES A PARTIALLY CLOSED POSITION SHOW ONE AVERAGE PRICE?

Because that is the honest summary — the volume weighted average of the parts.

WHY IS MY WIN RATE HIGH BUT MY PROFIT NEGATIVE?

Win rate says nothing about size. Look at Average Win vs. Average Loss, and Profit Factor — the single most common pattern among losing retail accounts.

CAN I CHANGE THE COLOURS TO MY OWN BRAND?

Yes — set "Use Custom Colours Below" to true. The theme switch then stops changing the appearance.

CAN I REMOVE THE "POWERED BY FOREXGURU.PK" FOOTER?

No — it is part of the product identity.

Notes For Teachers And Study Groups

This section is written for the instructor. You may remove it before giving the file to students, or leave it in.

19.1 A Thirty Minute Classroom Sequence

- 1 Switch to the **Light** theme first. Dark gold on a projector washes out.
- 2 Overview tab. Set Account Growth to Growth %. Ask which line is real growth, and why the grey line can rise while the gold line stays flat.
- 3 Switch the same panel to Drawdown. Ask how many *weeks* the account spent under water, not how deep it went. Depth frightens students; duration teaches them.
- 4 Statistics tab. Cover the Profit Factor and ask the class to predict it from win rate alone, then reveal it.
- 5 Analytics tab. Average Holding Time — ask why the green and red bars differ. Let them find the "cutting winners, holding losers" bias themselves.
- 6 History tab. Risk Metrics & Records — point at Max Cons. Losses and ask each student to calculate what their own risk per trade would have done through that run.

19.2 Making Good Screenshots For Students

- Switch to the Light theme — it prints and projects far better.
- Collapse every panel except the one you want to teach; it expands to fill the screen.
- Raise "Master Font Size %" to 140–150 for a projector.
- The footer already carries the trader name, currency and account number.

19.3 A PRIVACY WARNING BEFORE YOU PUBLISH

The header shows the broker name and the **account login number**, and the footer repeats it. Before posting a screenshot publicly or sending it to a student group, cover both, or use a demo account for public material.

19.4 A Homework Exercise That Works

Ask each student to send three screenshots: Statistics tab with History Days = 0, Statistics tab with History Days = 90, and Analytics tab with History Days = 90. Then ask one question: "In the last ninety days, did you get better, or did you get luckier?" The Profit Factor, Expectancy and Reward:Risk panel between them will answer it — and the student will have done the work.

SECTION 20

Support And Contact

Email	support@forexguru.pk support@digitech.com.pk
Phone	+92-300-6561240
Websites	ForexGuru.Pk DigiTech.Com.Pk

WHEN YOU WRITE TO SUPPORT, PLEASE INCLUDE:

1. Your MetaTrader 5 account number and broker name.
2. The version, exactly as shown on the About tab (Version 9.00 for this file).
3. A screenshot of the whole chart, showing the problem.
4. If a close attempt failed, the exact status line, including the number — for example: "Close Failed: 10018 Market is closed".
5. If the dashboard did not start, the contents of the Experts tab in the terminal Toolbox.

Support cannot help with trading decisions, strategy selection, or broker disputes. Support exists for the software.

SECTION 21

Legal Notice And Risk Disclaimer

This dashboard reads your own account history. It never opens or modifies a trade. A position closes only after you confirm it twice on screen.

PAST RESULTS DO NOT GUARANTEE FUTURE RESULTS

Every figure in this product describes something that has already happened. Nothing in it is a prediction, a recommendation, an invitation, or financial advice of any kind. Trading foreign exchange and contracts for difference carries a high level of risk and can result in the loss of all of your capital. Do not trade with money you cannot afford to lose. If you are unsure, seek advice from an independent and appropriately licensed adviser.

The publisher accepts no liability for any trading loss, missed opportunity, data error, or platform failure connected with the use of this software. The software is provided as it is. Traders are responsible for complying with the laws and regulations that apply to them in their own country.

© 2026 Digital Technologies Pakistan. All rights reserved. ForexGuru.Pk Taurus Vision Trader Dashboard, the Taurus Vision brand mark, and the Taurus product family names are the property of the publisher. This software may not be resold, rebranded, decompiled or redistributed without written permission from the publisher.

SECTION 22

What Is New In Version 9.00

- **One click trade closing** on the Current Active Trades panel, with a deliberate two step confirmation and a configurable confirm window. This is the change that required the product to become an Expert Advisor rather than a custom indicator.
- **A working sun / moon theme switch.** The glyphs are drawn with shapes rather than font characters, so they cannot fail on a machine missing a symbol font.
- **One shared pager** across every long table. Six tables that previously used three different, separately written paging mechanisms now use a single control with identical behaviour everywhere.

Version 9.00 also ships as a **single file**. There is no external logo bitmap and nothing has to be copied into the MQL5\Files folder.

OTHER BEHAVIOUR WORTH KNOWING ABOUT IN THIS BUILD

- The Reward : Risk panel now separates the three possible states and labels each one, instead of printing a dash for a symbol that has simply never taken a loss.
- Trade notifications from the terminal no longer trigger a full history rebuild inside the trade pipeline — they raise a flag, and the rebuild happens on the next timer beat, removing the momentary freeze that occurred whenever an order was placed.
- Only one chart click event is handled, fixing actions that used to fire twice from a single click.

- A confirm window of zero is no longer accepted; the value is forced into the range 2 to 60 seconds so the safety guard cannot be switched off by accident.
